

Sri Harsha Gorantla

Data Analyst → Data Engineer | Python · SQL · AWS · Power BI

Reading, UK 07435 854 294 sriharsha.gorantla97@gmail.com linkedin.com/in/sri-harsha-gorantla github.com/Sri-gorantla

PROFILE

Data professional with 3+ years of experience across the data lifecycle, building automated ETL/ELT pipelines, structuring relational databases, and delivering statistical analysis in Python and SQL on AWS. Track record of building analytics infrastructure from scratch and automating manual workflows to improve turnaround time and data reliability. Proven cloud data engineering capability through a self-built end-to-end AWS pipeline — S3, Glue (PySpark), star-schema warehouse, Airflow orchestration — see portfolio.

WORK EXPERIENCE

Data Analyst, Customer Operations

Sept 2024 – May 2026

Teleperformance Ltd, United Kingdom

- Investigated repeat contact patterns across 500k+ booking and interaction records, identified a cluster of cancellation and rescheduling behaviors driving avoidable callbacks, with recommendations contributing to a 10–15% reduction in repeat contacts.
- Own and maintain 8 live KPI dashboards in Power BI used by supervisors to manage daily operations, covering call handling time, booking success rates, cancellation volumes, and agent performance.
- Automated the weekly data extraction and report generation process using Python, reducing turnaround time by 30%.
- Conducted root cause analysis on the top recurring complaint categories, findings were incorporated directly into team training materials and SOPs, used by team leaders on an ongoing basis.
- Resolved dataset inconsistencies across call-log sources that were causing figures to differ between reporting tools, improving data reliability by 25% across the operations team.

Data Analyst

June 2023 – Aug 2024

Nurogen Healthcare Ltd, London

- Built the entire analytics function from scratch for a pharmaceutical excipient startup, joined with no existing reporting infrastructure and worked directly with the founders to establish what needed to be tracked and why.
- Structured and analyzed approximately 25,000 historical sales, inventory, and customer records, creating the data foundation the business needed before any meaningful reporting was possible.
- Delivered 7 Power BI dashboards used daily by the founders and management team for business reviews, covering sales trends by product, inventory movement, customer engagement patterns, and website performance.
- Ran customer segmentation analysis on the early customer base, grouping buyers by purchasing behavior, used by the marketing team to run targeted campaigns during the product rollout phase.
- Integrated Google Analytics with internal sales data to map the full customer journey, identifying specific drop-off points in the purchase funnel that informed website changes.
- Set up automated reporting pipelines using Python and SQL, establishing a structured data routine.

Project Controller | Academic Research Internship

Oct 2022 – May 2023

University of East London

- Built a regression-based cost estimation model on 500+ historical construction projects, achieving under 10% mean absolute error, more accurate than the manual approach previously used.
- Quantified for the first time that location and material specification were the strongest cost drivers, presented to an industry panel alongside academic examiner.

PORTFOLIO PROJECTS | GITHUB.COM/SRI-GORANTLA

Fraud & Risk Analytics Pipeline

Python · AWS (S3, Glue/PySpark, Redshift) · Airflow · Power BI

- Built an end-to-end cloud ETL pipeline processing 13,000+ simulated banking transactions — S3 raw landing zone (date-partitioned), AWS Glue (PySpark) transformation, star-schema warehouse (fact + 5 dimension tables), Airflow-orchestrated daily pipeline with idempotent loading.
- Designed and computed six fraud-pattern signals from first principles (velocity, geo-mismatch, amount anomaly, odd-hour activity, new-merchant exposure, card-not-present risk); a rule flagging 2+ simultaneous signals achieved 85.5% fraud detection at a 1.87% false-positive rate.
- Diagnosed and corrected a flawed detection signal mid-project — an initial geo-mismatch definition triggered on 83% of transactions due to a data design issue — redefined around rapid location change between consecutive transactions, reducing the trigger rate to a realistic 4.5% and materially improving rule precision.
- Documented full architecture decision record, data dictionary, and operational runbook alongside the codebase.

Operations KPI Dashboard

Python · SQL Server · Power BI

- Generated a 3,000-record case management dataset in Python covering 5 case types (ID Review, Eligibility Review, Document Check, Full Claim Review, Capital Review) across 3 teams, loaded into SQL Server as a structured relational database.
- Wrote KPI queries across 4 analytical areas: Volume & Status, Quality & Compliance, Efficiency, and Team & Agent Performance, calculating SLA met rate, escalation rate, rework rate, and average handling time by team and agent.
- Built a 5-view Power BI dashboard with a KPI summary page, team comparison, monthly trend chart, agent-level breakdown, and case type escalation analysis, all filterable through slicers for team, priority, and date range.

Pharma Analytics Suite: Pipeline Analysis & Customer Segmentation

SQLite · SQL · Power BI · DAX

- Built using direct knowledge of pharma excipient sales from time at Nurogen Healthcare, deal sizes, customer sectors, pipeline stages, and buying behaviour are all modelled on real experience rather than generic sample data.
- Pipeline analysis across 250 leads identified a 29% drop-off between Quoted and Negotiation stages, traced to minimum order quantity friction, analysis included a specific recommendation to introduce a trial order tier for smaller buyers.
- Customer segmentation involved a normalised SQLite database with 3 tables, 11 SQL queries using JOINS, GROUP BY, HAVING, and CASE WHEN, and a CTE-based RFM scoring model using NTILE(4), classifying all customers into 7 named segments with prioritized BD actions per segment.
- Both analyses connected to a 3-page interactive Power BI dashboard using DAX measures (CALCULATE, DIVIDE, VAR, SUMX) with cross-page slicers and a live database connection.

TECHNICAL SKILLS

Programming Languages: Python (Pandas, NumPy, Matplotlib, Seaborn), SQL (SQL Server, SQLite), DAX

BI & Reporting: Power BI, Excel (advanced), Tableau, Google Analytics

Cloud & Infrastructure: AWS (S3, Glue, Redshift, EC2, IAM, Lambda, RDS, CloudWatch), AWS CLI, AWS Management Console, Apache Airflow

Data Analytics & Engineering: ETL/ELT pipelines, database design and schema structuring (normalization, denormalization, star schema), data cleaning and reconciliation, data lifecycle management, Databricks, PySpark

Analysis Methods: EDA, RFM segmentation, regression modelling, KPI frameworks, root cause analysis, fraud pattern detection

Tools & Workflow: Git, GitHub, GitHub Actions (CI/CD), Jupyter Notebook, Agile, JIRA

CERTIFICATIONS

- AWS Certified Cloud Practitioner
- Microsoft Azure SQL — Coursera
- Python for Data Science & AI — Coursera
- Power BI Essential Training — Udemy / LinkedIn Learning
- Data Analytics — Coursera (IBM)
- Data Science — Teks Academy

EDUCATION

MSc Civil Engineering

University of East London, UK · Sept 2021 – June 2023

BTech Civil Engineering

Lovely Professional University, India · Aug 2016 – Sept 2020
